Fri, 05 Oct 2018 19:52:00 GMT - A shingles rash usually appears on one side of the face or body and heals within 2 to 4 weeks. Its main symptom is pain, which can be severe. Other symptoms can include fever, headache, chills, and upset stomach. Very rarely, a shingles infection can lead to pneumonia, hearing problems, blindness, brain inflammation (encephalitis), or death.

Wed, 10 Oct 2018 07:22:00 GMT - shingles can spread the chickenpox virus to others. Someone who has not had chickenpox can get chickenpox if they have close contact with a person who has shingles. This is why we place patients with shingles in airborne and contact precautions. People whose immune systems are weakened from illness or certain medicines can get disseminated Herpes zoster, a disease similar to chickenpox.

### **Shingles Herpes zoster - UWMC Health On-Line -**

Fri, 05 Oct 2018 08:11:00 GMT - Shingles is an infection caused by the same virus that causes chicken pox (varicella zoster). You cannot develop shingles unless you have had a previous infection with chicken pox, usually as a child. Shingles is also called Herpes Zoster, because the varicella virus is in the larger herpes family of viruses.

### **Shingles (Herpes Zoster) - Brown University -**

Wed, 10 Oct 2018 16:33:00 GMT - Shingles is contagious and can easily pass through touching from one person to another. The virus develops into shingles for people who have had chicken pox and develops into chicken pox for those who have not had it. Shingles appears most frequently among older adults (age 60+) and in people with compromised immune systems.

### **Shingles (Herpes Zoster) - Lancaster, PA Lancaster Skin Center -**

Wed, 10 Oct 2018 05:42:00 GMT - years, at least half will have had herpes zoster. In addition to getting older, other factors such as having a weakened immune system, psychological stress, physical trauma, being a woman and genetic susceptibility, e.g. a history of related family members getting herpes zoster, can increase the risk of getting shingles.
